64-bit, 1-bit per word random access
read/write memory

HEF4505B
LSI

DESCRIPTION

The HEF4505B is a 64-bit, 1-bit per word, fully decoded and completely static, random access memory. The memory is strobed for reading or writing only when the strobe input (ST), chip enable inputs (CE₁ and CE₂) are HIGH simultaneously. The output data is available at the data output (D_{OUT}) only when the memory is strobed, the read/write input (R/ \overline{W}) is HIGH and after the read access time has passed. Note that the three-state output is initially disabled and always goes to the LOW state before data is valid. The output is disabled in the high-impedance OFF-state, when the memory is not strobed or R/ \overline{W} is LOW. R/ \overline{W} may remain HIGH during a read cycle or LOW during a write cycle. The output data has the same polarity as the input data.

PINNING

A ₀ to A ₅	address inputs
CE ₁ , CE ₂	chip enable inputs
R/ \overline{W}	read/write input
ST	strobe input
D _{IN}	data input
D _{OUT}	data output

FUNCTION TABLE

ST, CE ₁ , CE ₂	R/ \overline{W}	D _{OUT}	MODE
L	L	Z	disabled
H	L	Z	write
L	H	Z	disabled
H	H	equal to memory data	read

Note

1. H = HIGH state (the more positive voltage)
L = LOW state (the less positive voltage)
Z = high-impedance OFF-state

HEF4505BP(N): 14-lead DIL; plastic
(SOT27-1)
HEF4505BD(F): 14-lead DIL; ceramic (cerdip)
(SOT73)
(): Package Designator North America

SUPPLY VOLTAGE

RATING	OPERATING
-0,5 to +15	4,5 to 15 V

Note

1. Minimum standby voltage for data retention is 3 V.

APPLICATION INFORMATION

64-bit, 1-bit per word random access read/write memory

HEF4505B
LSI

Figure 5 shows a 256-word by n-bit static RAM system. The outputs of the four HEF4505B circuits are tied together to form 256 words by 1-bit. Additional bits are attained by paralleling the inputs in groups of four. Memories of larger words can be attained by decoding the most significant bits of the address and AND-ing them with the strobe input.

Fan-in and fan-out of the memory are limited only by speed requirements. The extremely low input and output leakage currents keep the output voltage levels from changing significantly as more outputs are tied together. With the output levels independent of fan-out, most of the power supply range is available as logic swing, regardless of the number of units wired together. As a result, high noise immunity is maintained under all conditions.

The memory system shown in Fig.5 can be interfaced directly with other ICs of the LOCMOS HE family. No external components are required.

Non-volatile information storage is allowed due to very low power dissipation when the memory is powered by a small standby battery. Figure 6 shows an optional standby power supply circuit for making a LOCMOS memory 'non-volatile'. When the usual power fails, a battery is used to sustain operation or maintain stored information. While normal power supply voltage is present, the battery is trickle-charged through a resistor (R) which sets the charging rate. In Fig.6 the sustaining voltage is V_B , and +V is the ordinary voltage from a power supply. V_{DD} is connected to the power supply pin of the memory. Low-leakage diodes are recommended to conserve battery power.
