

## MAX4376/MAX4377/ MAX4378

## Single/Dual/Quad, High-Side Current-Sense Amplifiers with Internal Gain

### General Description

The MAX4376/MAX4377/MAX4378 single, dual, and quad precision high-side current-sense amplifiers are available in space-saving packages. They feature buffered voltage outputs that eliminate the need for gain-setting resistors and are ideal for today's notebook computers, cell phones, and other systems where current monitoring is critical. These precision devices are offered in three fixed-gain versions of 20, 50, and 100:

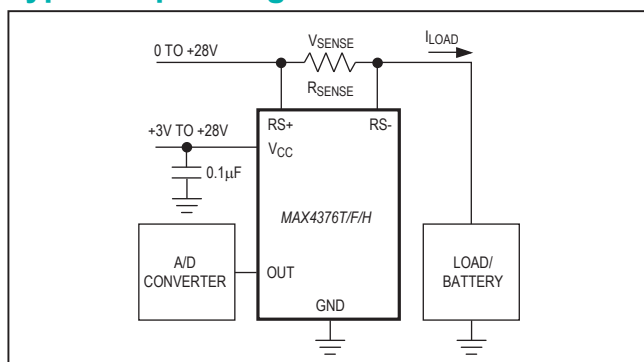

GAIN	SUFFIX
20	T
50	F
100	H

For example, MAX4376TAUK is a single high-side amplifier with a gain of 20.

High-side current monitoring is especially useful in battery-powered systems since it does not interfere with the ground path of the battery charger. The input common-mode range of 0 to +28V is independent of the supply voltage and ensures that the current-sense feedback remains viable even when connected to a battery pack in deep discharge.

The full-scale current reading can be set by choosing the appropriate voltage gain and external-sense resistor. This capability offers a high level of integration and flexibility, resulting in a simple and compact current-sense solution. The MAX4376/MAX4377/MAX4378 operate over a supply voltage range of +3V to +28V, draw 1mA of supply current per amplifier, and operate over the full automotive temperature range of -40°C to +125°C. These devices have a wide bandwidth of 2MHz, making them suitable for use inside battery-charger control loops. The buffered outputs drive up to 2mA of output current into a ground-referenced load. The MAX4376 is available in a tiny 5-pin SOT23 package. The MAX4377/MAX4378 are available in space-saving 8-pin  $\mu$ MAX<sup>®</sup> and 14-pin TSSOP packages, respectively.

### Typical Operating Circuit

### Features

- Low-Cost, Single/Dual/Quad, High-Side Current-Sense Amplifiers
- $\pm 0.5\%$  Typical Full-Scale Accuracy
- +3V to +28V Supply Operation
- Adjustable Current-Sense Capability with External Sense Resistor
- Buffered Output Voltage with 2mA Drive
- 1mA (typ) Supply Current
- 2.0MHz Bandwidth (Gain = +20V/V)
- Automotive Temperature Range (-40°C to +125°C)
- High Accuracy +2V to +28V Common-Mode Range, Functional Down to 0V, Independent of Supply Voltage
- Three Gain Versions Available
  - +20V/V (MAX437\_T)
  - +50V/V (MAX437\_F)
  - +100V/V (MAX437\_H)
- Available in Space-Saving 5-Pin SOT23 (Single), 8-Pin  $\mu$ MAX (Dual), and 14-Pin TSSOP (Quad)
- AEC-Q100 Qualified, Refer to Ordering Information for the List of /V Parts

### Applications

- Notebook Computers
- Current-Limited Power Supplies
- Fuel Gauges in PC
- General-System/Board-Level Current Monitoring
- Battery Chargers
- Portable/Battery-Powered Systems
- Cell Phones
- Smart Battery Packages
- Automotive Current Detect
- Power Management Systems
- PA Bias Control
- Automotive

$\mu$ MAX is a registered trademark of Maxim Integrated Products, Inc.

 Junction Temperature ..... +150°C  
 Storage Temperature Range ..... -65°C to +150°C  
 Lead Temperature (soldering, 10s) ..... +300°C  
 Soldering Temperature (reflow) ..... +260°C

*Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

### Package Information

#### 5 SOT23

PACKAGE CODE	U5+2, U5+2A
Outline Number	<a href="#">21-0057</a>
Land Pattern Number	<a href="#">90-0174</a>
<b>Thermal Resistance, Multi-Layer Board:</b>	
Junction to Ambient (θ <sub>JA</sub> )	255.90°C/W
Junction to Case (θ <sub>JC</sub> )	81°C/W

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

## Detailed Description

The MAX4376/MAX4377/MAX4378 high-side current-sense amplifiers feature a 0 to +28V input common-mode range that is independent of supply voltage. This feature allows the monitoring of current out of a battery in deep discharge and also enables high-side current sensing at voltages greater than the supply voltage ( $V_{CC}$ ).

The MAX4376/MAX4377/MAX4378 operate as follows: current from the source flows through  $R_{SENSE}$  to the load (Figure 1). Since the internal sense amplifier's inverting input has high impedance, negligible current flows through  $R_{G2}$  (neglecting the input bias current). Therefore, the sense amplifier's inverting-input voltage equals  $V_{SOURCE} - (I_{LOAD})(R_{SENSE})$ .

The amplifier's open-loop gain forces its noninverting input to the same voltage as the inverting input. Therefore, the drop across  $R_{G1}$  equals  $(I_{LOAD})(R_{SENSE})$ . Since  $I_{RG1}$  flows through  $R_{G1}$ ,  $I_{RG1} = (I_{LOAD})(R_{SENSE})/R_{G1}$ . The internal current mirror multiplies  $I_{RG1}$  by a current gain factor,  $\beta$ , to give  $I_{RGD} = \beta \times I_{RG1}$ . Solving  $I_{RGD} = \beta \times (I_{LOAD})(R_{SENSE})/R_{G1}$ .

Therefore:

$V_{OUT} = b \times (R_{GD}/R_{G1})(R_{SENSE} \times I_{LOAD}) \times \text{amp gain}$   
where amp gain is 2, 5, or 10.

The part's gain equals  $(\beta \times R_{GD} / R_{G1}) \times \text{amp gain}$ .

Therefore:

$$V_{OUT} = (\text{GAIN})(R_{SENSE})(I_{LOAD})$$

where GAIN = 20 for MAX437\_T.

GAIN = 50 for MAX437\_F.

GAIN = 100 for MAX437\_H.

Set the full-scale output range by selecting  $R_{SENSE}$  and the appropriate gain version of the MAX4376/ MAX4377/ MAX4378.

## Applications Information

### Recommended Component Values

The MAX4376/MAX4377/MAX4378 sense a wide variety of currents with different sense resistor values. Table 1 lists common resistor values for typical operation of the MAX4376/MAX4377/MAX4378.

### Choosing $R_{SENSE}$

To measure lower currents more accurately, use a high value for  $R_{SENSE}$ . The high value develops a higher sense voltage that reduces offset voltage errors of the internal op amp.

In applications monitoring very high currents,  $R_{SENSE}$  must be able to dissipate the  $I^2R$  losses. If the resistor's rated power dissipation is exceeded, its value may drift or it may fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings.

If  $I_{SENSE}$  has a large high-frequency component, minimize the inductance of  $R_{SENSE}$ . Wire-wound resistors have the highest inductance, metal-film resistors are somewhat better, and low-inductance metal-film resistors are best suited for these applications.

### Bidirectional Current-Sense Amplifier

Systems such as laptop computers and other devices that have internal charge circuitry require a precise bidirectional current-sense amplifier to monitor accurately the battery's current regardless of polarity. Figure 2 shows the MAX4377 used as a bidirectional current monitor. This is useful for implementing either smart battery packs or fuel gauges.

### Current Source Circuit

Figure 3 shows a block diagram using the MAX4376 with a switching regulator to make a current source.
